
ANCIENT
Mortgage Infrastructure for the Borderless World.
115M+ Digital Nomads with Zero access to mortgages. We solve that.

Our financial system was built for a world that no longer exists.

We became borderless.
The banks did not.

The system is frozen in **1975**, designed for a life of one job, one country, and one bank.

The Human Cost: 115 million global citizens are financially invisible

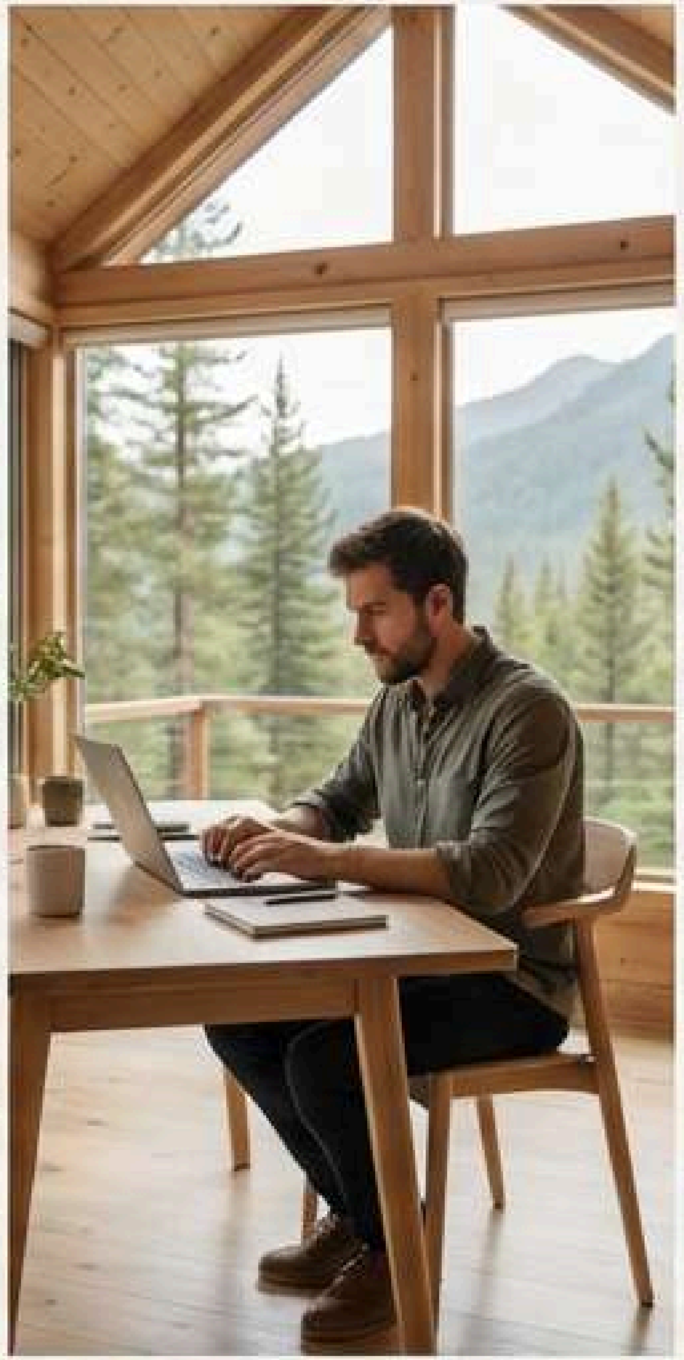
115M+

80 Million Digital Nomads

35 Million Remote Workers

The Pain Point

They earn high incomes ($50k–$250k+) but are systematically rejected by legacy banks, forcing them to rent.



These people aren't risky. They're invisible to a banking system that never evolved.
This is a $750B mortgage failure rooted in broken infrastructure, not a lack of demand.

A $300 Trillion Asset Class and a $1 Trillion Capital Pool That Can't Connect.

$300 TRILLION
Global real estate market value.

Real Estate is the World's Largest Asset Class.

Crypto is its Most Liquid Capital Pool.

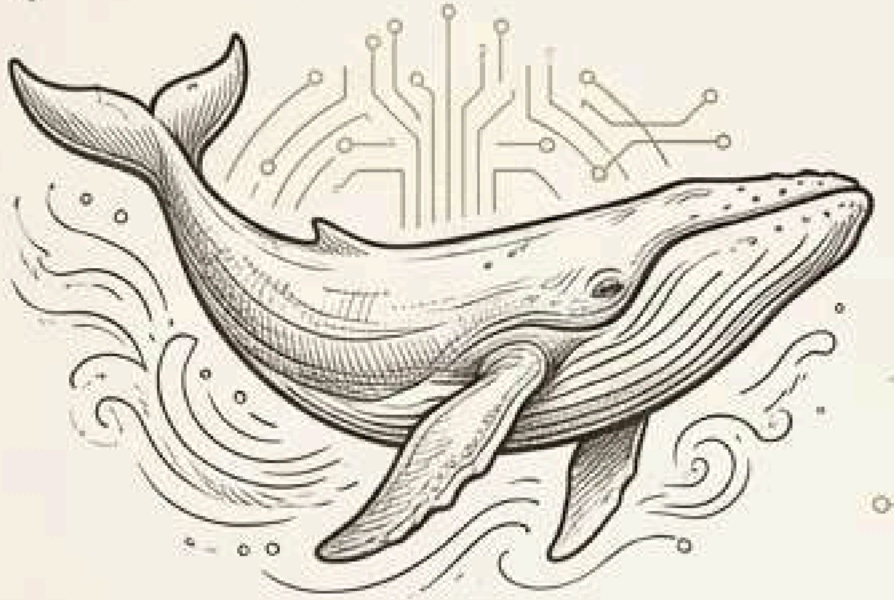
The Problem? They Can't Talk to Each Other.

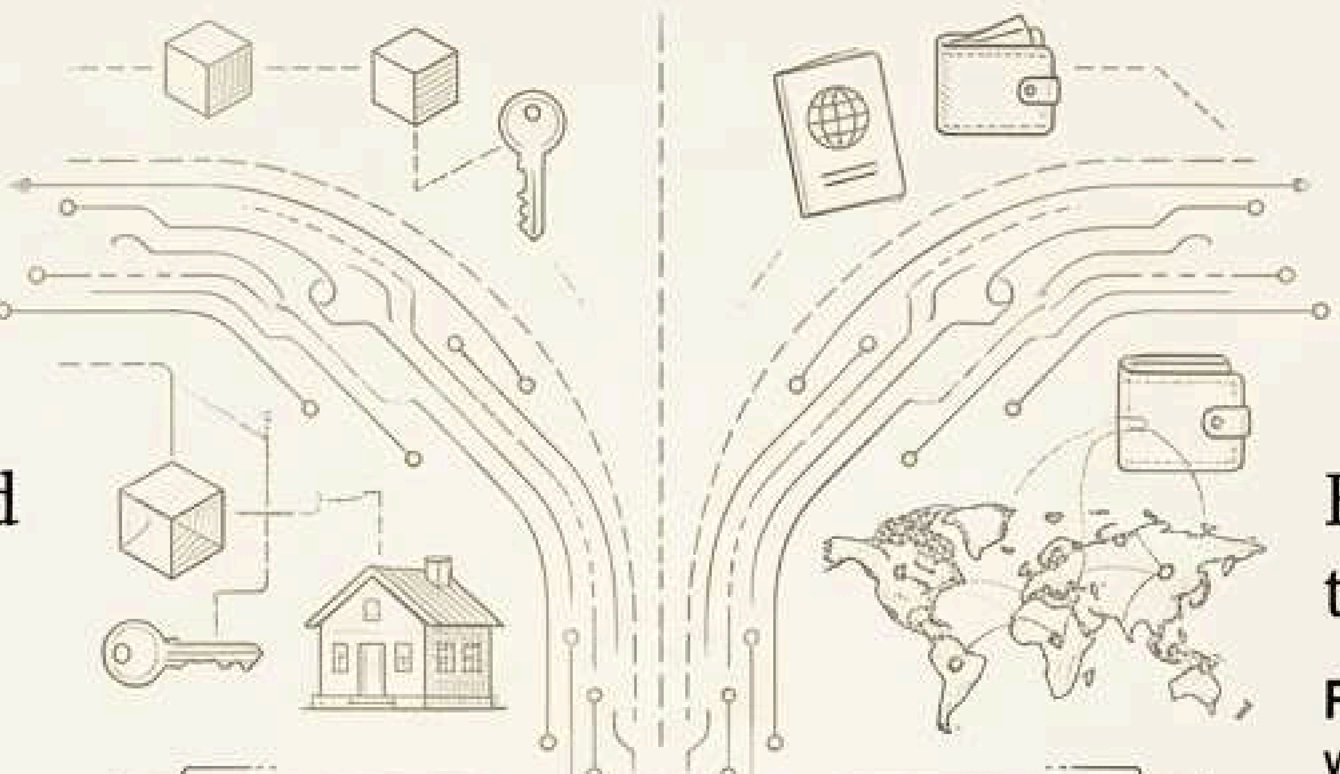
- Zero global mortgage rails.
- Zero borderless credit systems.
- Zero infrastructure for cross-country property ownership.

$1+ TRILLION
Crypto liquidity, largely sitting idle.

Ancient is building the missing financial rail.

A Dual-Engine Lending Protocol for Two Orphaned Markets





Engine A: BTC-Collateralized Mortgages

For: Crypto holders with $1T+ trapped on-chain.

How it Works: Stake Bitcoin/ETH to receive a 0-10% interest mortgage. No selling → No tax event → No loss of upside.

The Breakthrough: Crypto becomes a global down payment—instantly, anywhere.

The Software Output:

Every payment mints a Repayment NFT, creating the On-Chain Credit Report (OCCR). This is our AWS moment.

Engine B: Credit Access for the Global Mobile Class

For: 115M nomads earning in USD/EUR who cannot access local credit.

How it Works: 20% down, 10% fixed-rate mortgage. Underwriting uses income, wallet reputation, and residency signals.

The Breakthrough: Nomads finally get the one thing they've never had: a global, portable, bankless credit identity.

A $750B Mortgage Blackout and $1 Trillion in Trapped Crypto Wealth.

The Mortgage Blackout

The Void: If just 10% of the Global Mobile Class wants to **buy a $150k home, it creates** **$1.8 Trillion in unserved demand.**

Why Banks Fail: They rely on national systems that are useless **for global citizens:**

- **No FICO outside home country**
- No cross-border credit rails
- No consistent underwriting for **foreign income**

The Result: A $750B/year mortgage gap nobody can underwrite

The Trapped Crypto Wealth

The Dilemma: Over $1 Trillion in BTC/ETH wealth is sitting idle.

Why it's Trapped:

- **Selling triggers a 20-37% capital gains tax event.**
- Owners miss out on future **asset appreciation.**

The Result: Wealthy individuals can't use their **digital assets to acquire real-**world assets like homes.

Four tectonic shifts make this the perfect moment.

Nomad Surge

Grown 5X since 2019. Projected to reach 1 Billion by 2035. The forgotten high-income class.

Crypto Wealth Demands Real Assets

$1.1T in crypto wealth is trapped. Selling BTC triggers 20-37% capital gains tax. Our model solves this.

Global Mortgage Collapse

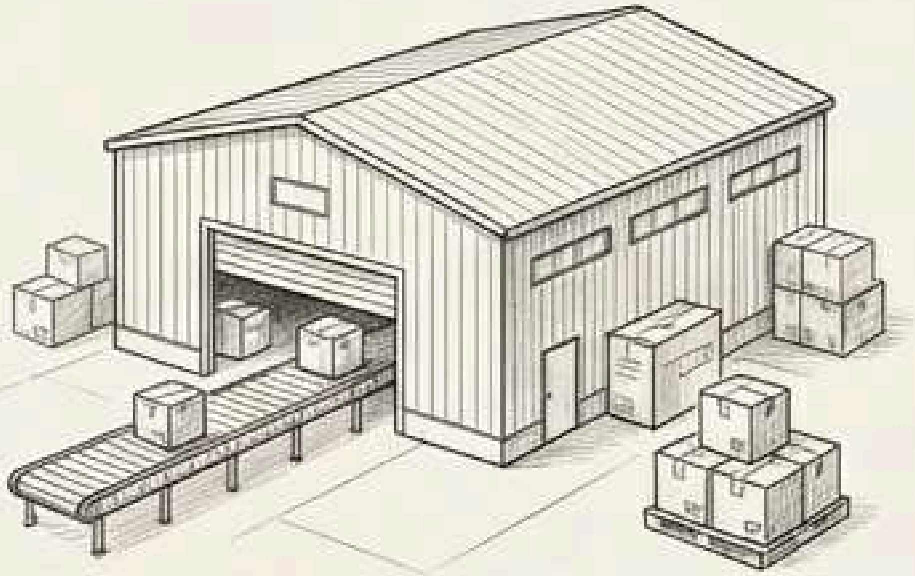
Local mortgage rates in LATAM & SE Asia are 12-45%, forcing markets to run on cash and locking out millions.

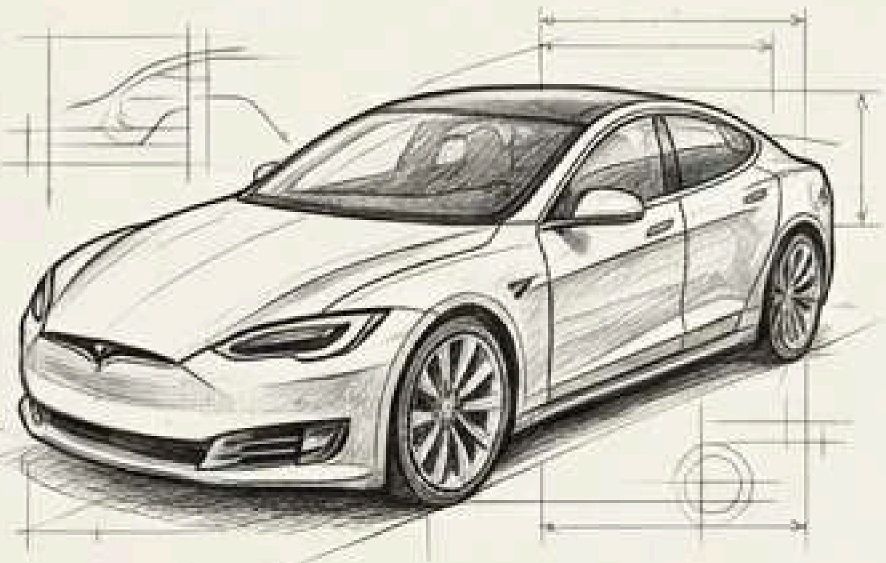
Legal Rails Unlocked

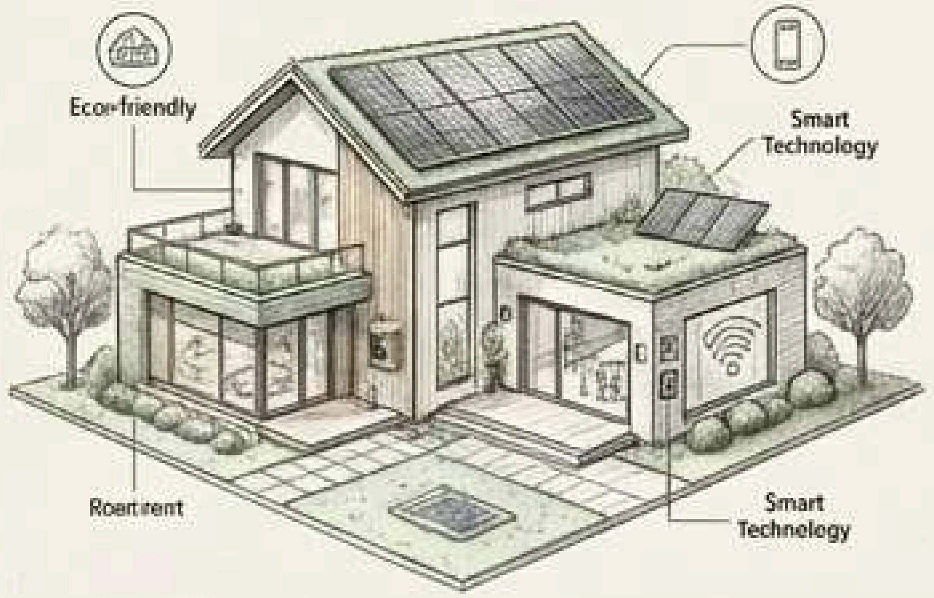
New title-retention laws (Reserva de Dominio) enable instant, court-less foreclosure, making global mortgage enforcement programmable.

The Paradigm Shift: We Build Hardware to Bootstrap Software

Great platform companies use physical assets to generate proprietary data and build an unassailable software moat.







Amazon: Built warehouses → to launch AWS.

Tesla: Built cars → to train Autopilot.

Ancient Protocol: Builds homes → to launch a global mortgage protocol.

Strategy Explained

Our first 32 homes are not the business—they are the data lab. They allow us to prove: cross-border underwriting, repayment behavior and risk, crypto-collateralized lending, and our legal enforcement mechanism.

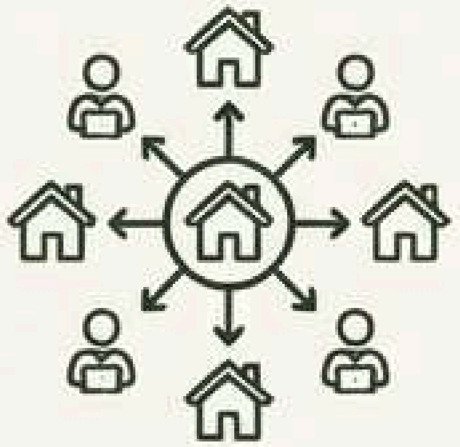
The homes are our customer acquisition engine. The protocol is the billion-dollar business.

From a Controlled Lab to a Global Mortgage Standard.

Years 1–3
(Seed Phase - The Lab)

Build and finance our own 32 homes in Peru & Brazil.

Perfect legal rails (Title Retention) and data rails (OCCR).



Years 3–5
(Series A - Horizontal Scale)

Secure institutional credit lines (~6-8%). Lend at 10-11%. Open the protocol to 3rd-party developers.

Become the financing layer for 1,000+ homes without laying a brick.

Years 5–10
(Series B - Securitization)

Bundle mortgage NFTs into "Ancient Bonds." Sell to MakerDAO, pension funds, and L1 treasuries.

Become the "BlackRock of On-Chain Mortgages."

We are not raising capital to test a theory. We are scaling a proven model.

The Trilogy of Proof

Phase 1 (Live & Profitable)

12 units operating in Sacred Valley, Peru.
Generating 19% net yields.

Phase 2 (Building & Densifying)

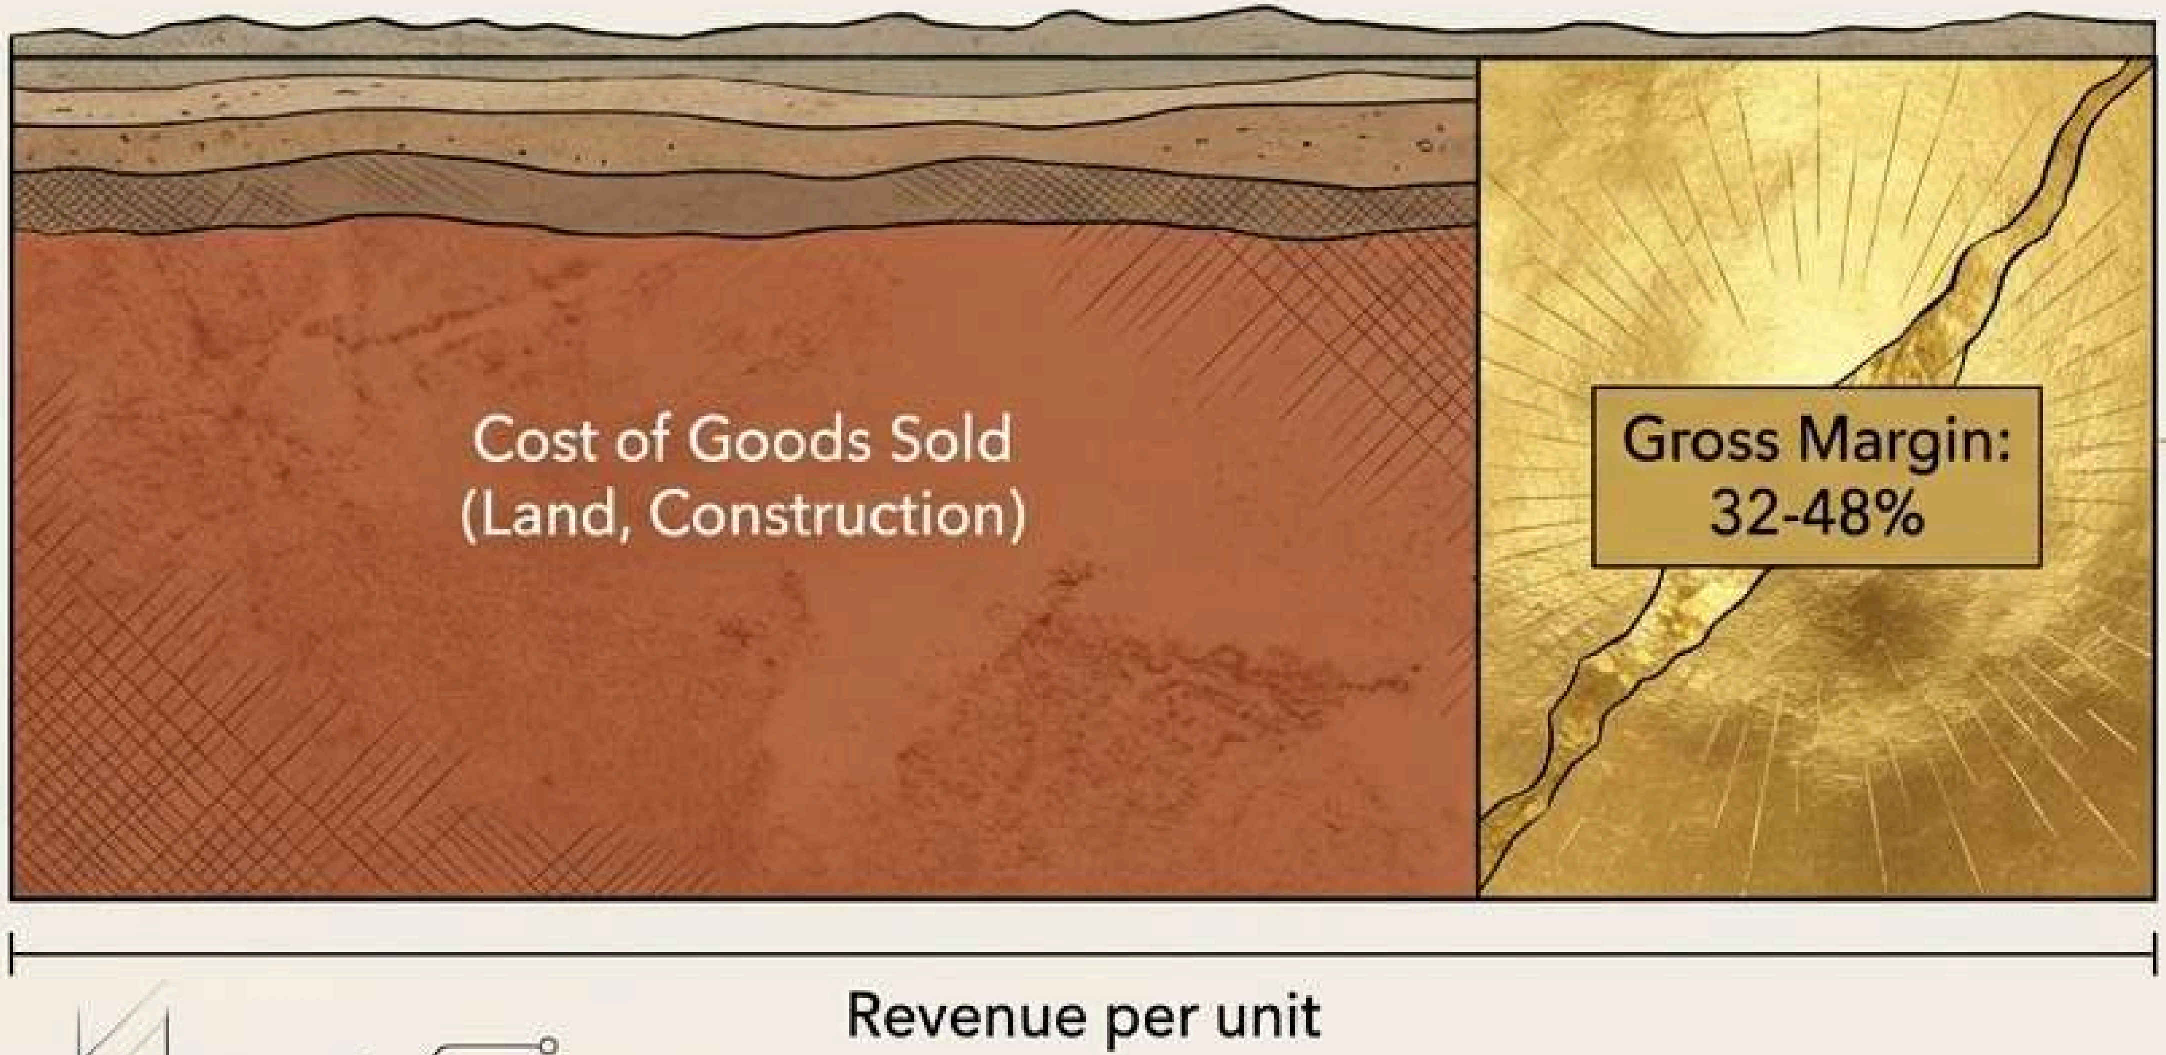
16-unit apartment complex fully funded and under way, proving construction and permitting capabilities.

Phase 3 (Scaling to Mortgages)

15 custom homes in "Bitcoin Valley."
Land identified. Waitlist active.
Raising $1.9M to break ground.

The 'Safety Floor': Our Hardware is Profitable, Recycling Capital, Not Burning It.

Investors fear that building homes is a low-margin cash burn. Our vertical integration proves the opposite. The hardware phase is designed to be self-sustaining and protect principal.



- Even if the software protocol takes years to scale, the underlying development business is profitable.
- This allows us to recycle capital into new projects, continuously feeding the data flywheel.
- Downside is floored by debt-free, high-yield real estate assets, not vaporware code.

The Flywheel: From Hardware to a Global Protocol

Step 1. **BUILD HARDWARE:**

Use seed capital to build 32 homes in Peru & Brazil.

Step 2. **ORIGINATE MORTGAGES:**

Onboard buyers, creating a **~$3.46M** mortgage book.

Step 3. **GENERATE PROPRIETARY DATA:**

Every repayment builds the On-Chain Credit Report (OCCR), proving the underwriting and risk model.

Step 4. **ATTRACT INSTITUTIONAL CAPITAL:**

Use the performing mortgage book and OCCR data to secure **$20M-$50M** in low-cost debt.

Step 5. **FINANCE 3RD-PARTY DEVELOPERS:**

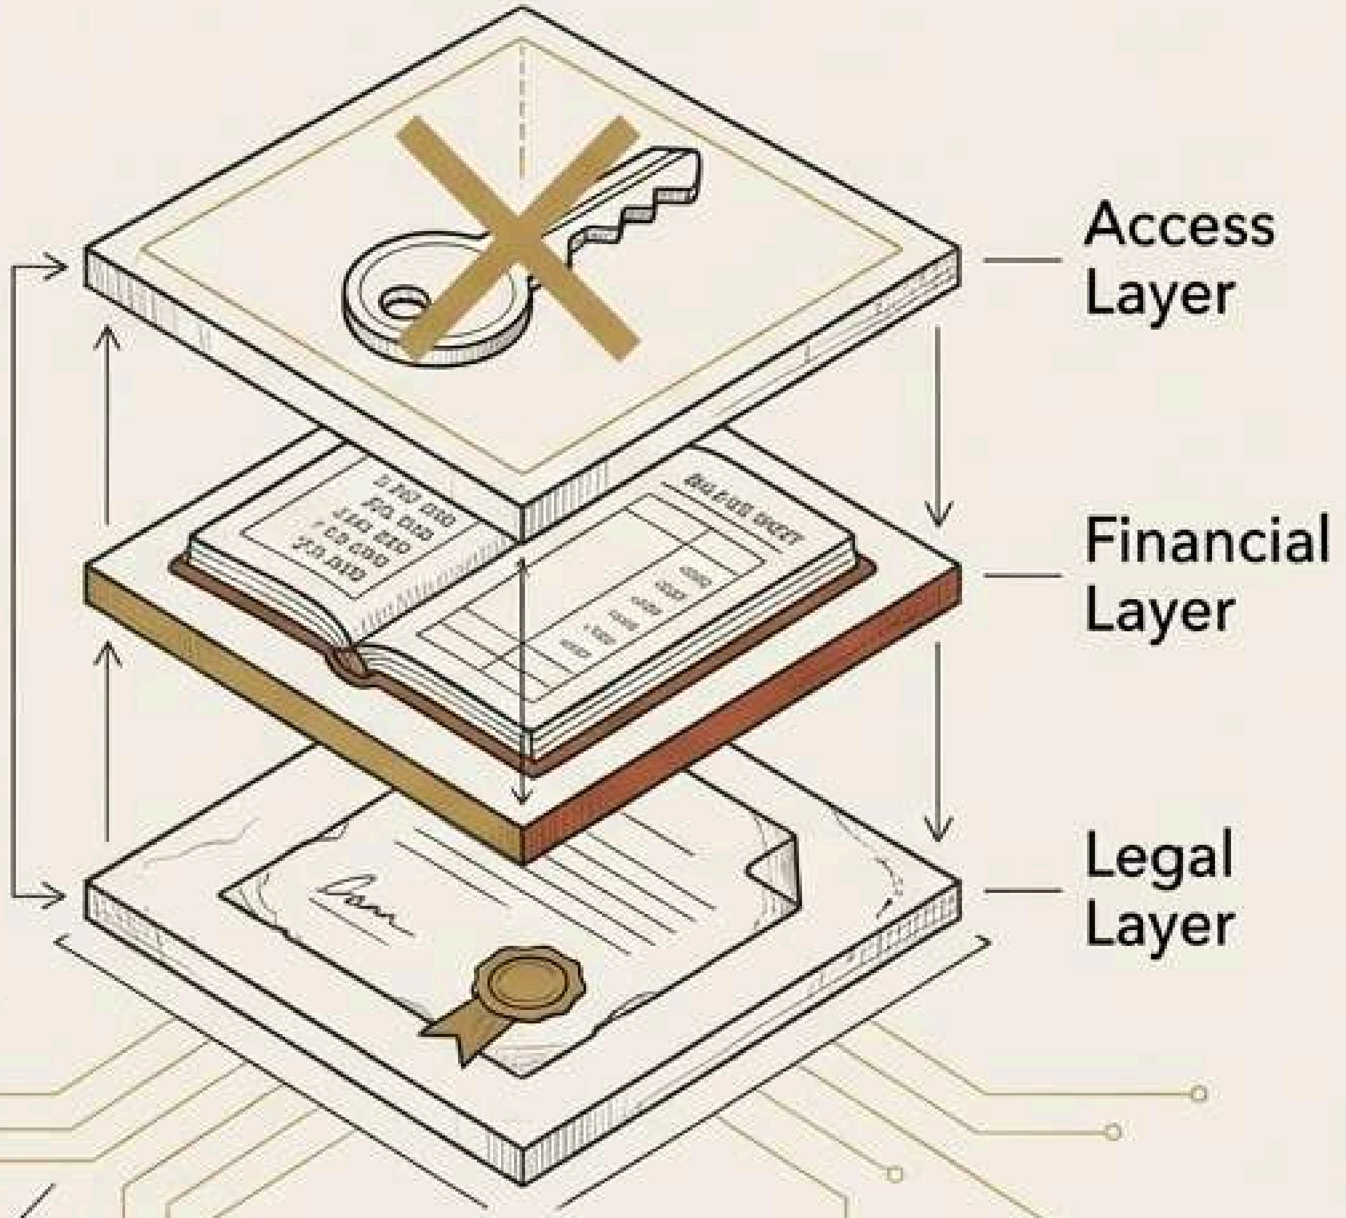
Stop building homes. Use the credit facility to become the mortgage engine for other developers globally.

Step 6. **SCALE THE PROTOCOL:**

More developers lead to more mortgages, which generates more data, strengthens the OCCR, attracts more capital, and solidifies our network effect.

The Enforcement Layer: Our "Kill Switch" Makes Default Profitable

Core Innovation: We use "Title Retention" (Reserva de Dominio). Ancient Protocol retains 100% legal title until the final dollar is paid. This is bridged on-chain with our Title-Wrapper NFT.

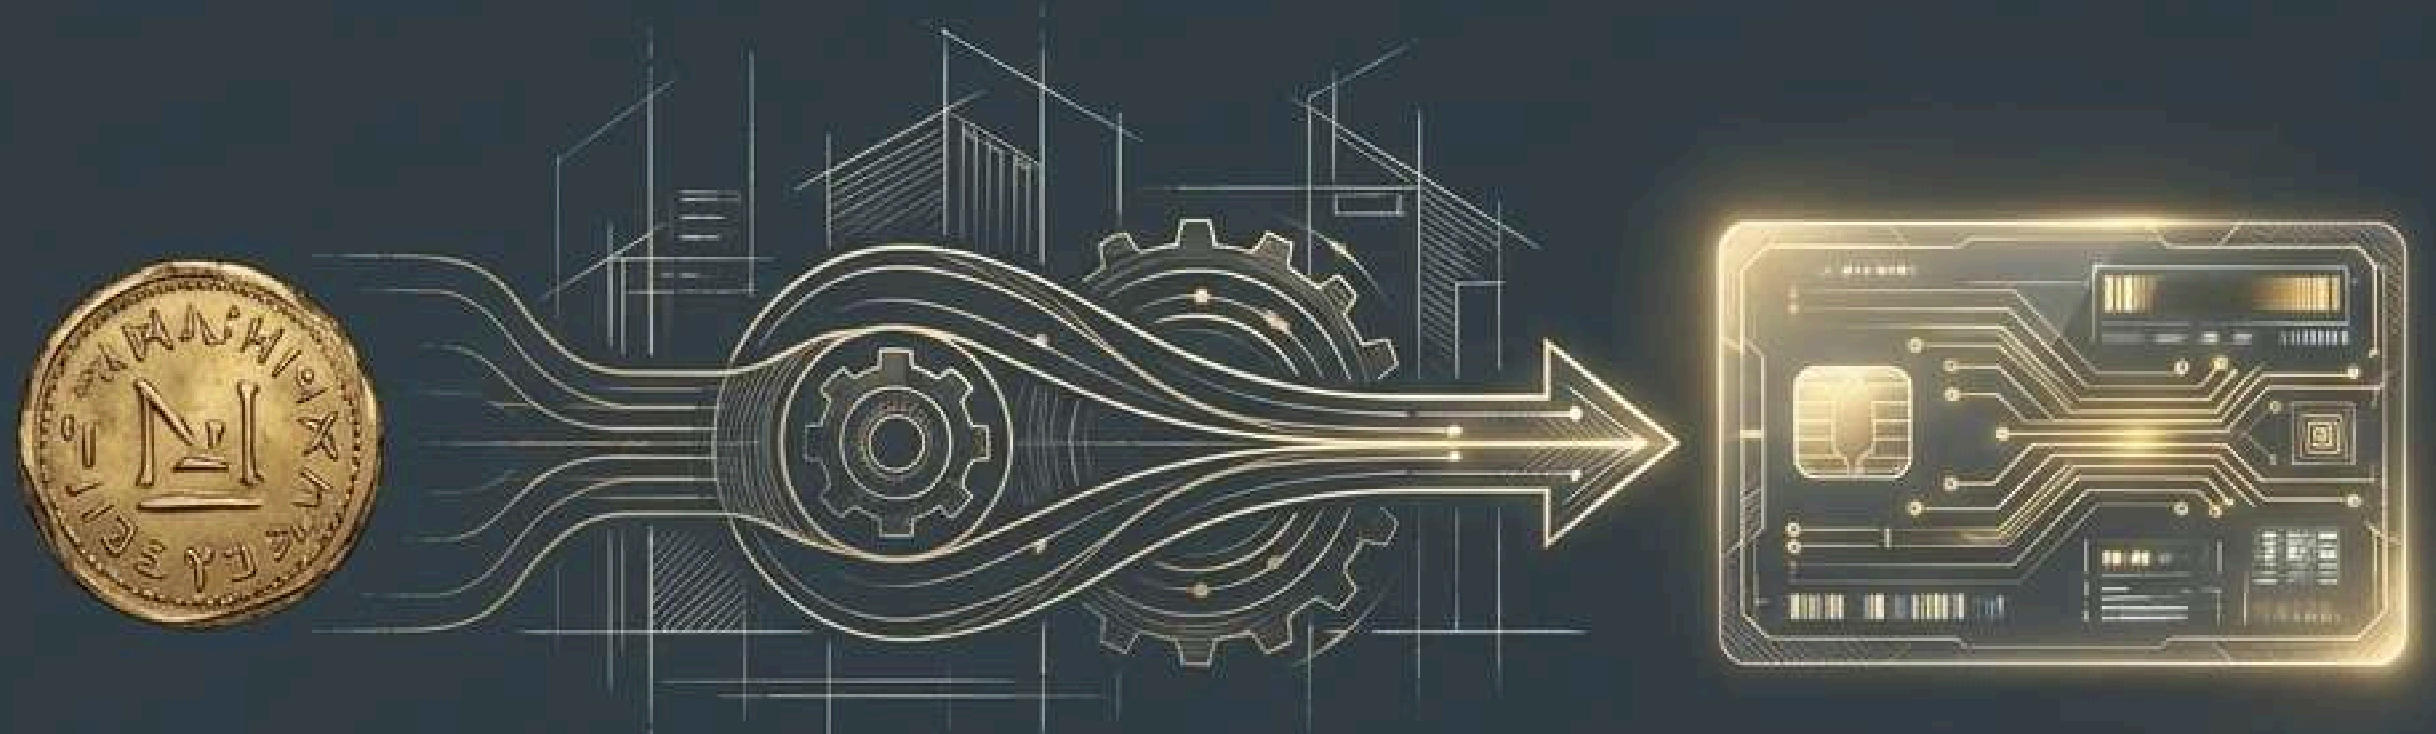


The Problem it Solves: Software-only lenders (TrueFi, Maple) failed because they have zero real-world enforcement.

The "Kill Switch" Mechanism:
- If a buyer stops paying, the Smart Contract revokes their access NFT.
- We physically reclaim the asset immediately. No foreclosure courts.

The Financial Result: Default becomes profitable. We seize the asset and place it in our short-term rental pool.
(Example: Rental Income: $18k/yr vs. Debt Service: $7k/yr. Coverage: 2.5x).

Payments Are More Than Cash Flow—They Are Data. We Are Building the Equifax of Crypto.



The Innovation: The On-Chain Credit Report (OCCR)

- Every monthly mortgage payment mints a "Repayment NFT" on-chain.
- This creates a verifiable, portable, and borderless credit identity that is immutable proof of payment history tied to a real-world asset.

Key Differentiator

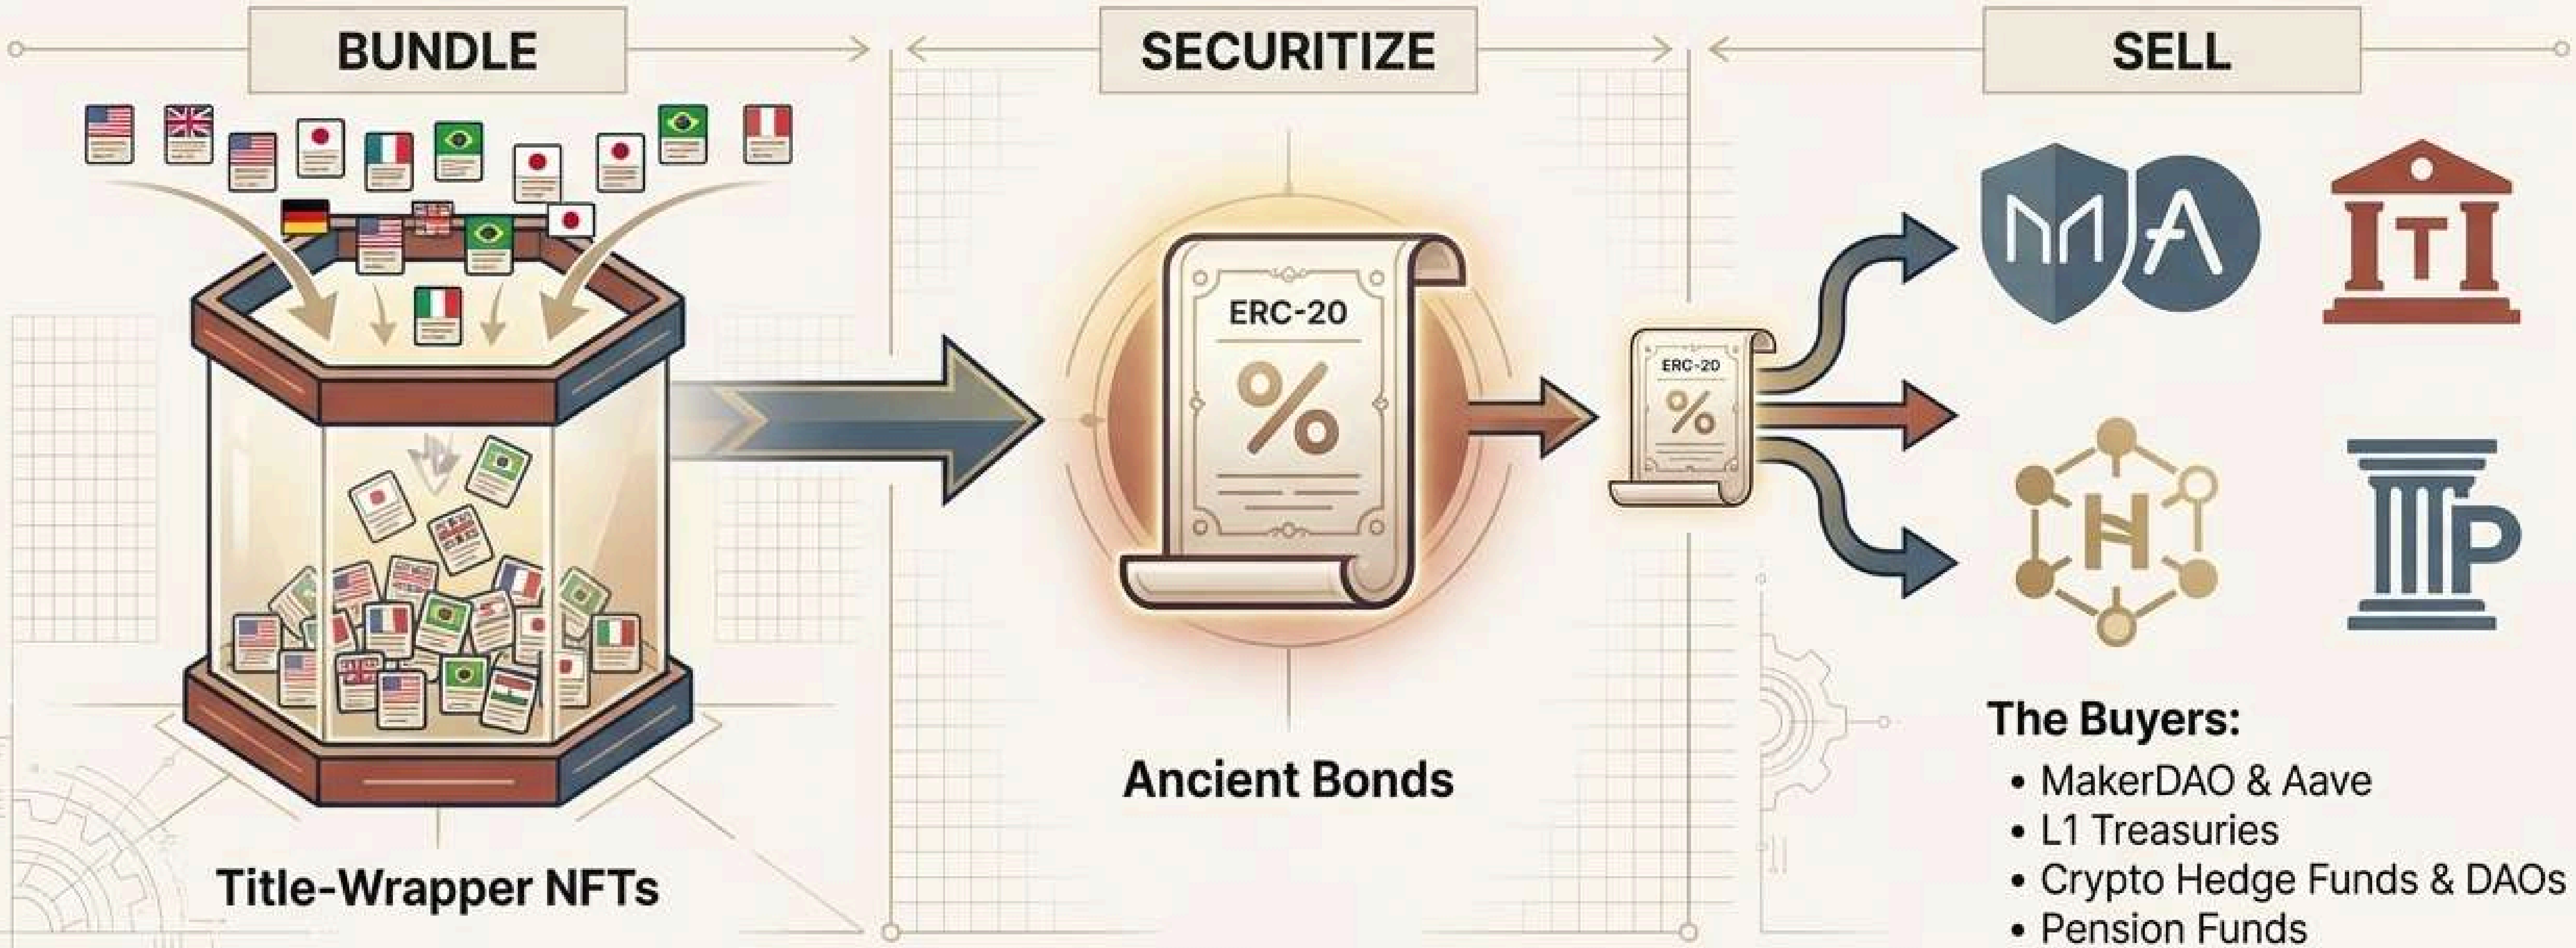
Solves the core underwriting problem for DeFi: wallet history is not real credit; OCCR is.

The Data Product

We license OCCR data to other DeFi protocols (Aave, Compound, etc.). This creates a high-margin, SaaS-style revenue stream, separate from lending and construction.

The Endgame: Building the Fannie Mae of On-Chain Mortgages

Vision: To create the first decentralized, global mortgage bond market.



This is a Multi-Layered Fintech Business Model.

Ancient's Model

Mortgage Interest Spread: Borrow at ~6%, lend at 10%. (Our core engine).

Origination & Developer Fees: 3% from the buyer, 5% from third-party developers who integrate.

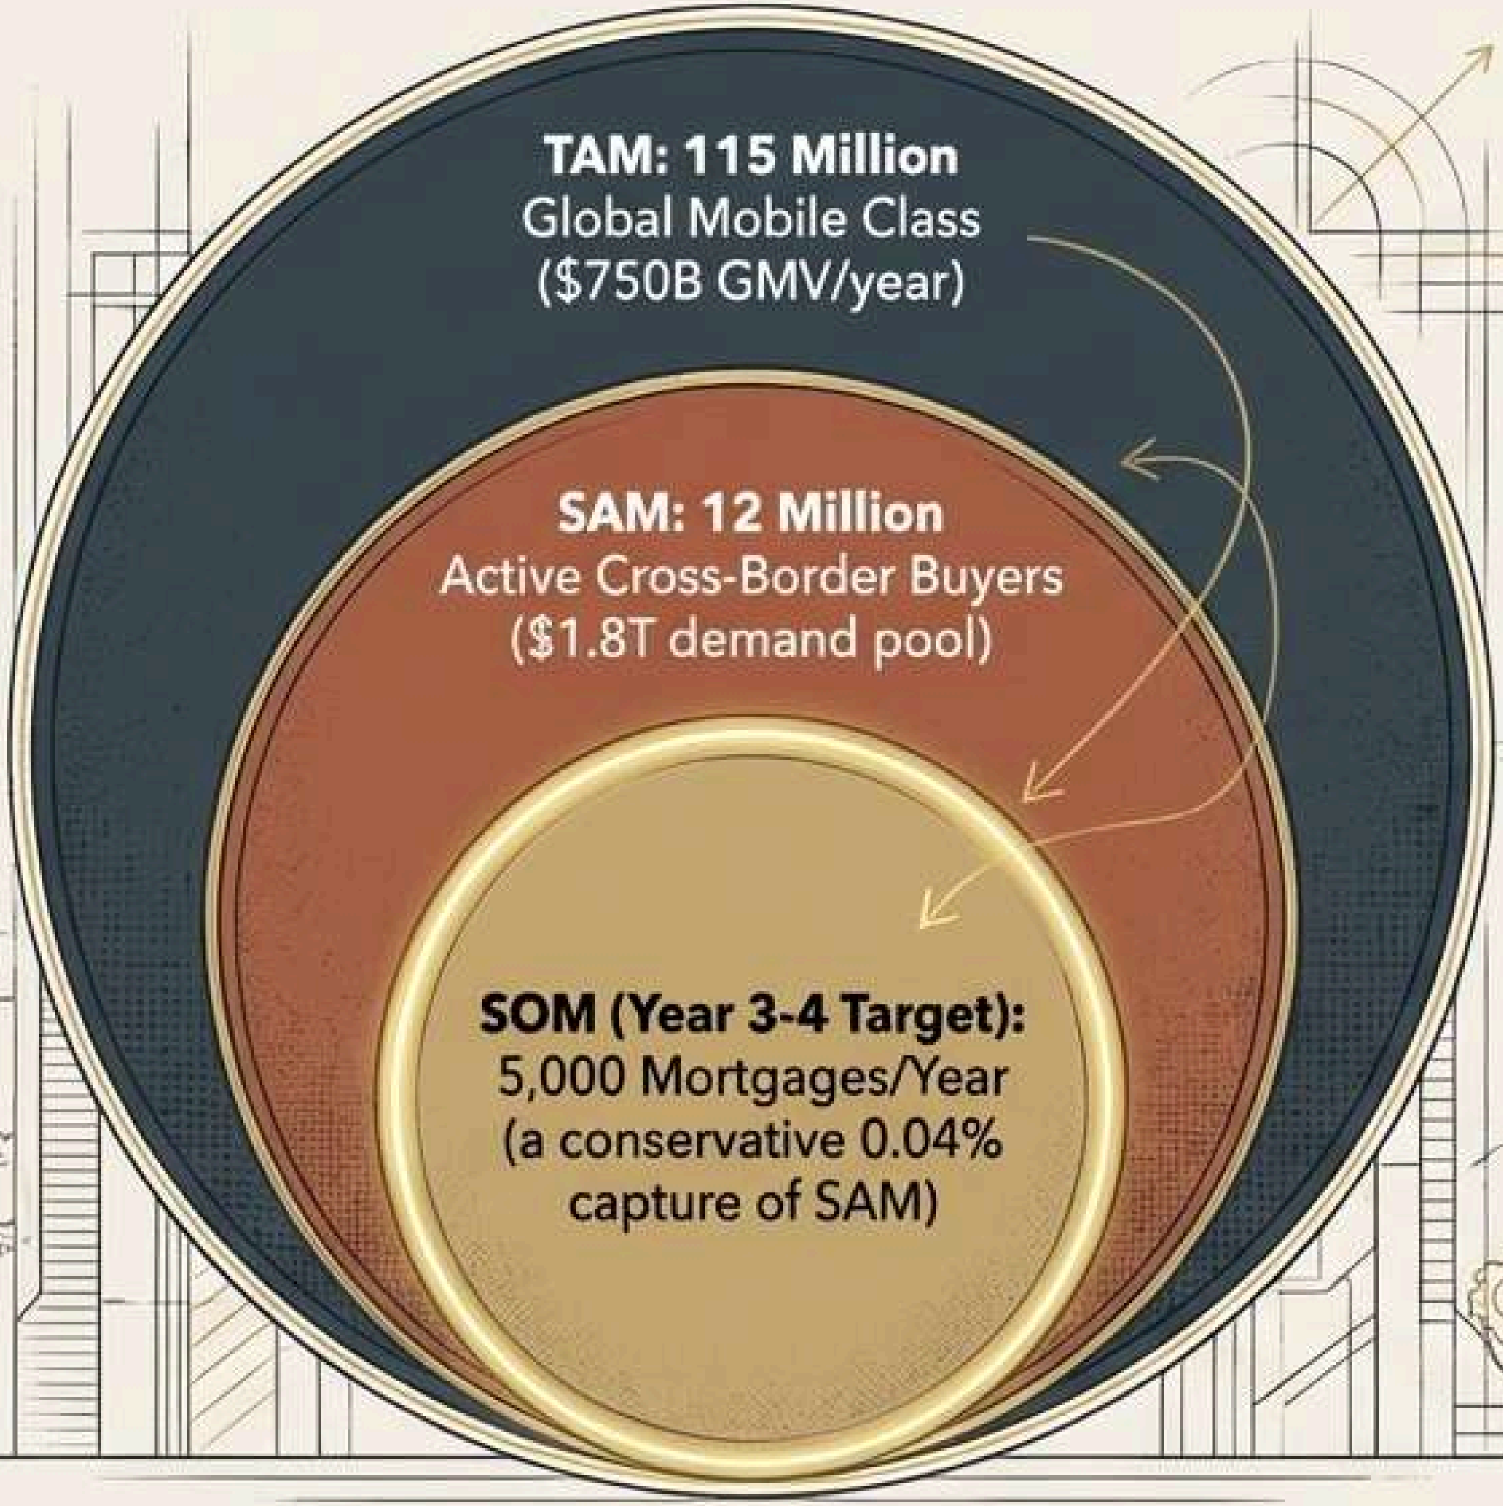
Servicing Fees: Recurring revenue on every payment flowing through the protocol for 20-30 years.

OCCR Data Licensing: License the world's first borderless credit identity to other DeFi lenders (Aave, Compound).

Construction Margin (Bootstrapping Only): 32-48% margin on initial builds funds the tech development and validates the model.

This is Stripe + Rocket Mortgage + Plaid — for global real estate.

Capturing 0.04% of Active Buyers Creates a Path to a 100x+ Return



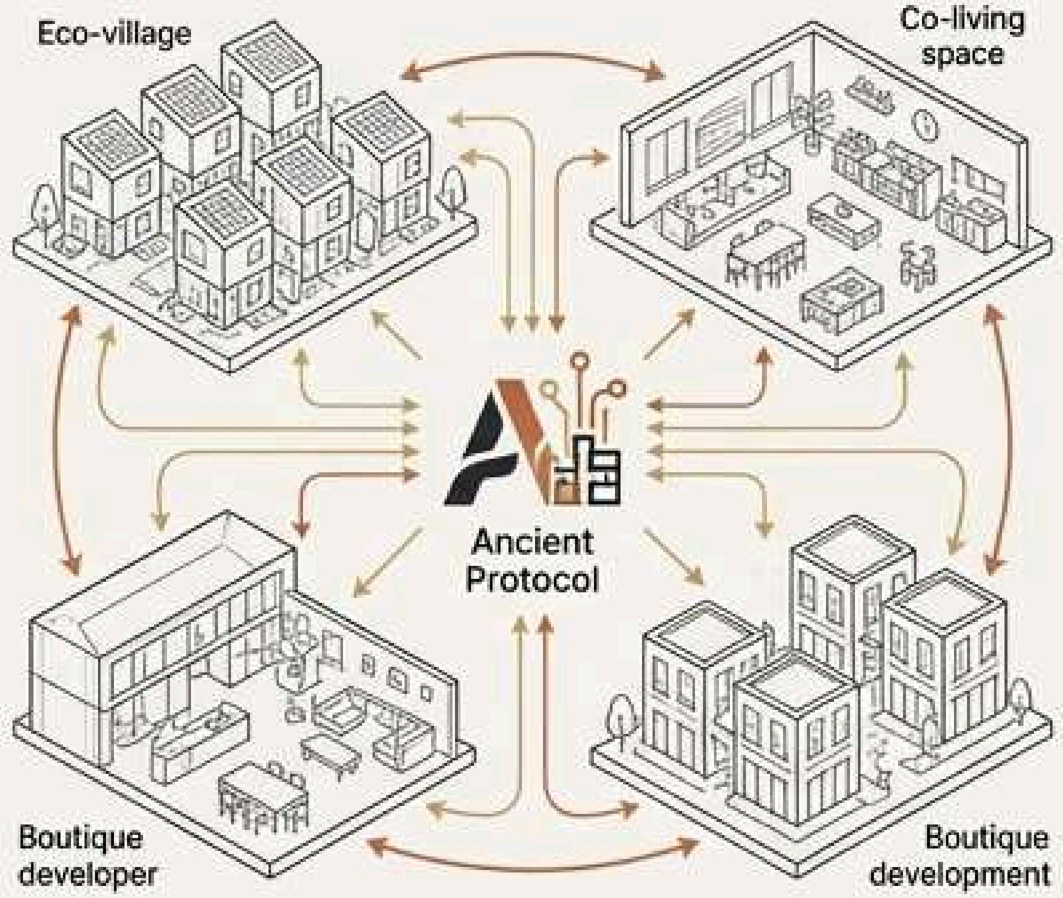
Revenue at SOM

- **$22M+** in recurring revenue from interest rate spread.
- **$12M–$15M** in origination and platform fees.

Valuation Milestones

- **Seed** ($1.9M): $10-12M Valuation
- **Series A** (Post 2 Flips, Credit Line Secured): $70-100M Valuation
- **Series B** (5k+ Mortgages Originated): $300-500M Valuation
- **Exit / IPO**: $1.5B - $3B+

The Vision: Becoming the Stripe + FICO for Global Real Estate



Phase 1: Build the Data Lab (Years 0-2)

Activity: Build 32 homes with the seed round.
Goal: Prove underwriting, enforcement, and generate 12-24 months of repayment data (the first OCCRs).

Phase 2: Become the Lender of Record (Years 2-4)

Activity: Secure institutional credit lines. Stop building homes.
Goal: Become the go-to financing partner for boutique developers, eco-villages, and co-living projects globally.

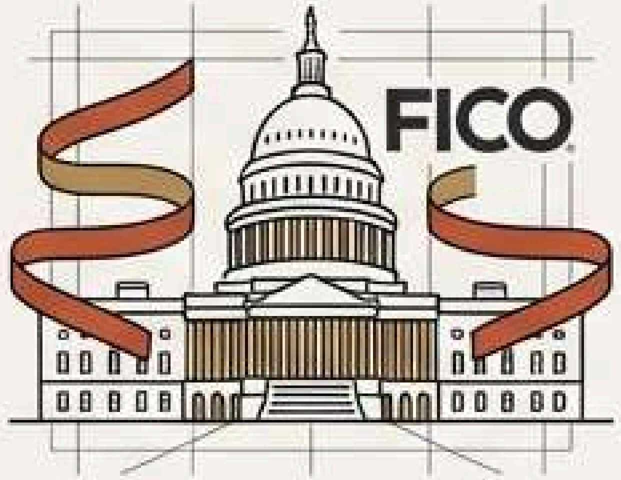
Phase 3: Become the Global Mortgage Network (Years 4-10)

Activity: Open the protocol rails for all developers.
Goal: Ancient no longer builds or directly lends. It becomes the essential software layer: the underwriting engine, servicing engine, credit oracle, and enforcement layer. This is **AWS for real estate credit**.

An Uncopyable Model: Why No One Else Can Do This

Our advantage comes from integrating four pillars that competitors cannot bridge.

US Mortgage Tech
(Rocket, Better)



Rationale

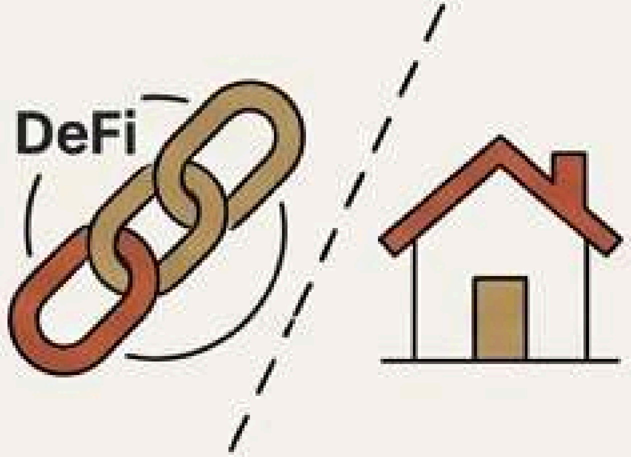
Cannot Compete. Legally bound to US soil and FICO. Their infrastructure breaks at the border.

Real Estate Tokenization
(Lofty, RealT)

Rationale

Not a Competitor. They are fractional ownership apps, not lending engines. They have no underwriting, credit layer, or enforcement.

Crypto Lending Protocols
(Aave, MakerDAO)



Rationale

Potential Partners, Not Competitors. They are powerful credit rails but lack the legal entities, title-holding capacity, and off-chain enforcement mechanisms for real estate. They can *fund* us, but cannot *be* us.

Local Developers
(Habitas, Tulum Builders)

Rationale

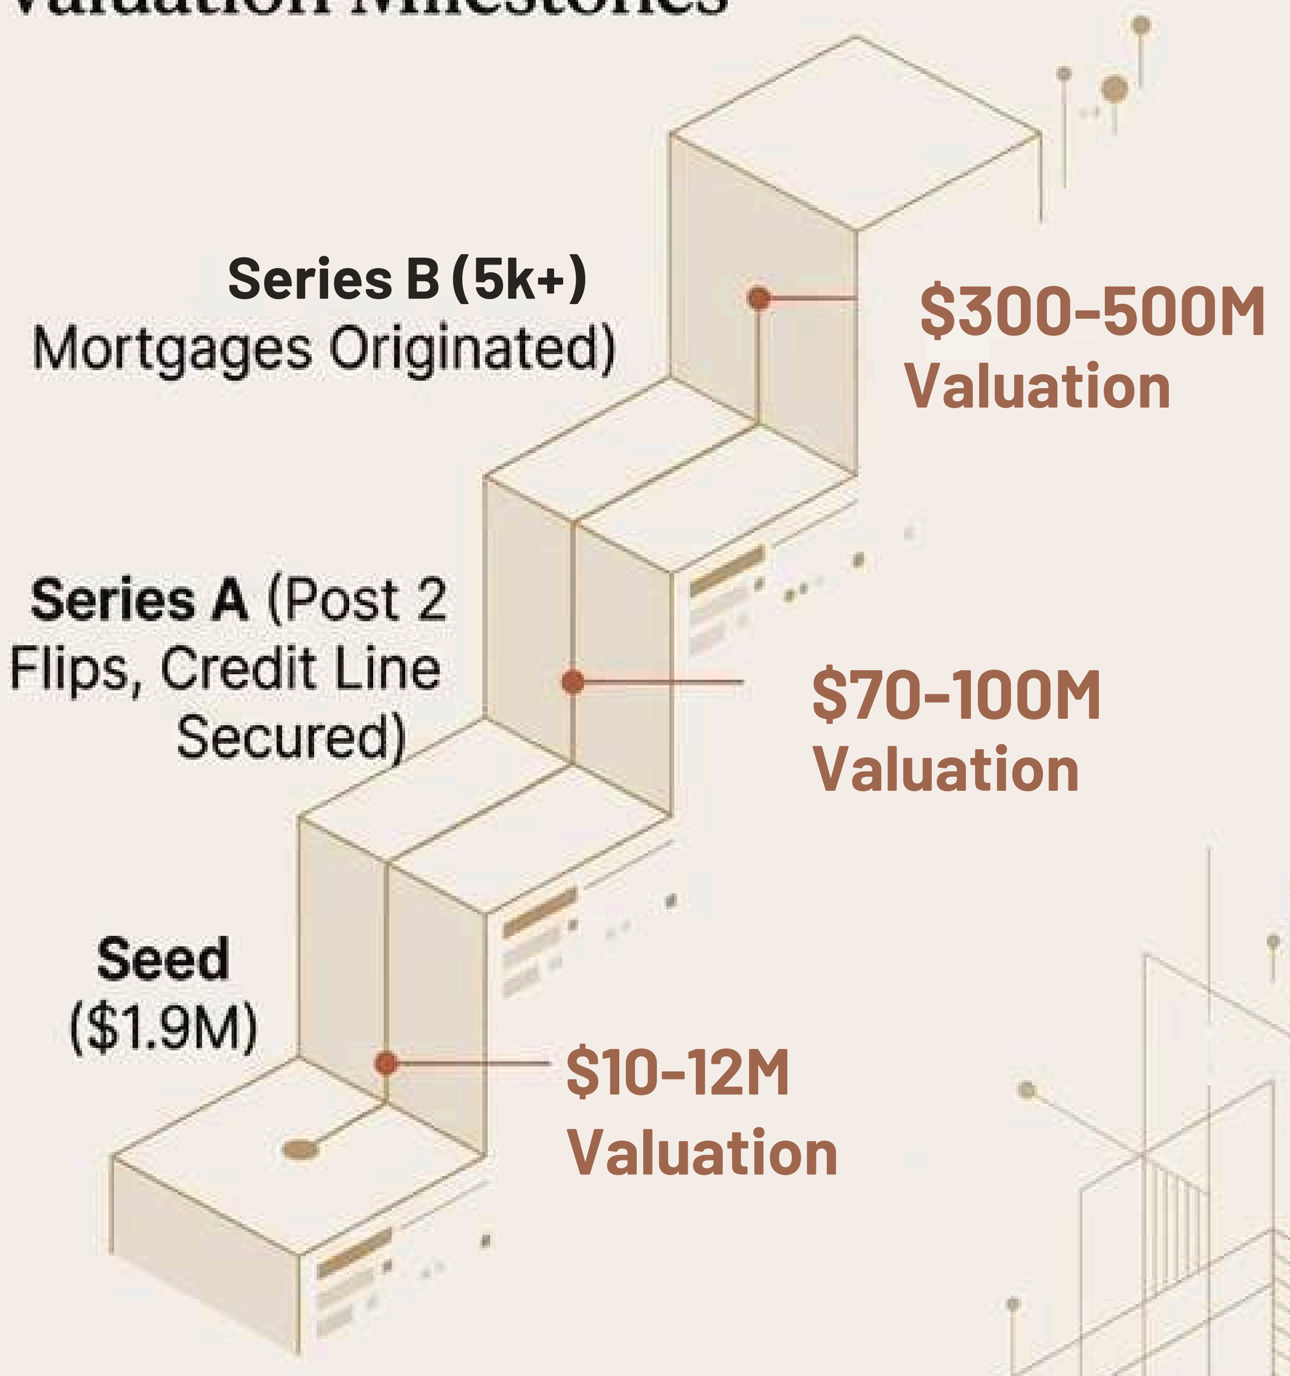
Our Future Customers. They build the supply, but they do not build financing rails, credit products, or scalable software. We become the financing layer for all of them.

Ancient owns a category that does not exist today:
Global, enforceable, crypto-enabled mortgages.

The Path to a 50-150x Return

Rocket Mortgage returned >90x to early investors by digitizing underwriting for one country.
We are doing it for the entire world.

Valuation Milestones



Exit Scenarios / IPO ($1.5B - $3B+)

The Global Mortgage Bank

Acquired by Rocket, SoFi, or Visa for its global lending rails and mortgage book.

The On-Chain Credit Bureau

The OCCR data becomes the global FICO for nomads; acquired by an Experian or Plaid.

The Developer Financing Rails

Acquired by Stripe to become the infrastructure for all real estate transactions online.

VC-Scale Revenue Drivers

1. Interest Spread

Borrow at 6%, lend at 10%+. At scale, this is $500M+/year recurring.

2. Origination Fees

3% of every mortgage.

3. OCCR Licensing

High-margin SaaS/API revenue from our credit data.

ANCIENT

Real-World Builders and Protocol Architects.

Brady Williams - CEO

Real-world executor with 12 profitable units in Peru (19.75% yields).

Expert in LATAM construction, permitting, and legal structuring.

CEO & Founder of a Top-5 Google-rated retreat center in Peru.

Mehmet Guleryuz - CTO

5+ years building high-performance blockchain infrastructure

Led engineering at Breadcrumb, FloorMarkets Perp DEX, Inverter

Winner: ETHGlobal + Solana Demo Day + Chainlink/Scroll/ENS

Johnny - CMO/Product

Scaled consumer crypto products across Base & BNB Chain

Cofounder of Breadcrumb (5,800 users, 40+ integrations) & Levr

Led SquadSwap BD/Marketing: $750K public raise, scaled to #3 DEX on BNB

Winner: Gitcoin/Tezos (tokenomics), Algorand (marketing)

Beau (Van Metre) - Advisor

Institutional Grade: From a developer of 6,000+ units.

Ensures our operations and books are ready for institutional credit lines.

The Ask: $1.9M for an Asymmetric Bet on the Future of Real Estate.

Use of Funds ($1.9M):

- Peru Flip (15 units): **$750k**
- Brazil Flip (17 units): **$700k**
- Tech / OCCR Development: **$250k**
- Legal & Structuring: **$100k**
- Go-To-Market / Presales: **$100k**

Our Hardware protects the downside. Our Software delivers the upside.
We are raising to build the machine that does both.

Ancient Protocol

The Infrastructure That Connects a $1T Crypto Economy to a $300T Real Estate Market.
